BUILDING AREA

12,500 SF

COST

\$4M

Contra Costa County Public Works Building

As on many public projects, the team was challenged with designing to a very tight budget for this new Public Works building.

FTF's approach was to recommend a relatively new seismic resisting system that combined architectural and structural systems by laminating the gypsum board with sheet metal. This saved the client on material cost, labor cost and overall schedule, due to the simplicity of constructing this new system.

These solutions were instrumental in enabling the client to achieve their programming needs while at the same time meeting the aggressive budget.
